Applicants: Wen-Kei Lee, Tien-Hao Feng

Filing Date: 07/28/2004

Examiner: Nguyen, Hiep

Art Unit: 2816

APPL No.: 10/710,673

Docket. No.: WISP0051USA

Confirmation No.: 4672

Title: Booster

To: The Commissioner for Patents

P.O. BOX 1450

Alexandria, VA 22313-1450

Subject: Information disclosure statement Under

37C.F.R.§1.56.

Dear Sir:

This is an Information Disclosure Statement in accordance with the duty to disclose information material to patentability under 37 CFR \$1.56. The applicants wish to make of record each of the documents listed on the accompanying form PTO/SB/08.

PAGE 6/22\* RCVD AT 2/21/2006 10:19:43 PM [Eastern Standard Time]\* SVR:USPTO-EFXRF-6/25\* DNIS:2738300\* CSID:17039974517\* DURATION (mm-s)709-243

requested according to 37 C.F.R.S1.97(c)(2), for which a fee will set forth. The prior art documents contained in the information disclosure statement were cited in the communication from the Intellectual Property Office of Taiwan, on May 12, 2005 for a counterpart Taiwanese patent application number #093105973. Applicants sincerely hope that the examiner can consider the items contained in the information disclosure statement.

According to the requirement set forth in 37 CFR \$1.98 and MPEP 609, applicants are submitting a copy of items contained in the IDS: Micro-Electronics Magazine (published on Nov, 2001); Texas Instruments publication (published on Jan, 2000); and Chinese Publication #CN 1452307A (published on Oct 29, 2003).

The section in the Micro-Electronics Magazine which the Taiwanese examiner believes to be relevant is translated as follows: The components used by the boost converter and the buck converter are similar, but the circuit architecture are quite different, when the MOSFET ON, Vd will still charge the inductor, and the energy is stored on the inductor. When MOSFET OFF, the inductor voltage is reversed, and the input voltage Vd passes through a second body D to form a loop such that the output voltage Vo is greater than the input voltage Vd. In order to stabilize the output voltage, the voltage feedback obtains the voltage on the R2 resistance to the control circuit to control the working cycle of the MOSFET.

A translation of the abstract of the Chinese publication #CN 1452307A is as follows: A switching regulator control circuit for a PFM control is provided for ensuring a continually constant output transistor ON period to output a stable duty. A signal for turning ON an output transistor is feedback, a logic signal

between the feedback signal and an output signal of an output voltage control comparator is inputted as an oscillation start signal to an oscillating circuit. Thus, in the situation of a frequent variation in comparator output signal, an ON period for the output transistor is ensured when an output voltage approaches extremely close a set voltage.

Respectfully submitted,

Wunten blass
